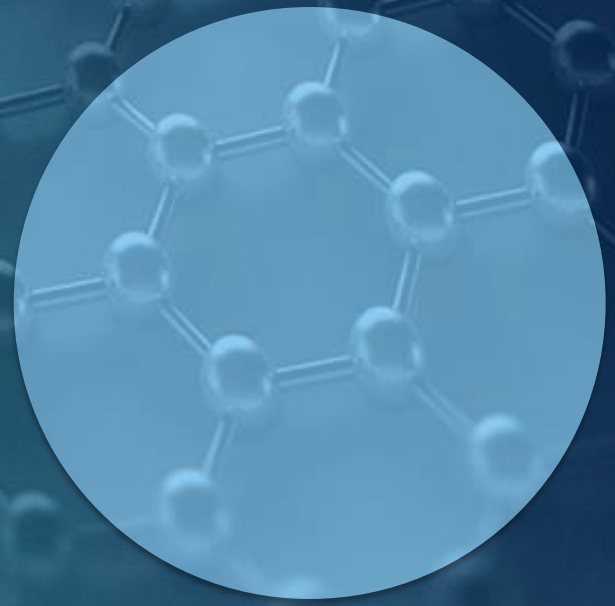
UdaPeople Modernization

ALWAYS CARING FOR OUR PEOPLE!



What is CI/CD

The practice or goal of CI/CD is to streamline the software development life cycle to deliver substantial results meeting business goals.

Udapeople today's challenge

We currently invest too much time in a release cycle thus value is often decreased.
Our currently deployment is contributing to constant schedule changes. Deployments are often too scary because it might break production and this could impact our revenue. This negative impact is costing out business increased operational cost, and higher time to market.

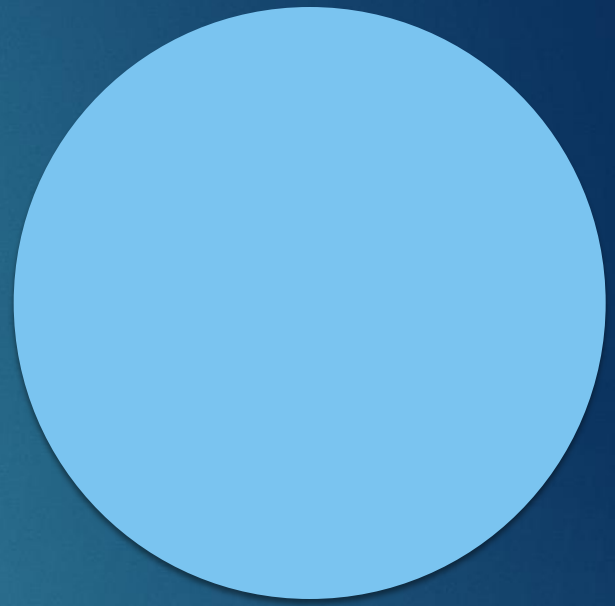
Udapeople Roadmap

By implementing a CI/CD not only we will increase delivery speed but also satisfaction. This will allow faster deployments with less human errors. Reducing time to market in any way shape, or form will always benefit the business. By shifting patterns as close to those attempting to make changes will result in the cheapest form of testing and feedback as part of a CI/CD pipeline.

What can we solve

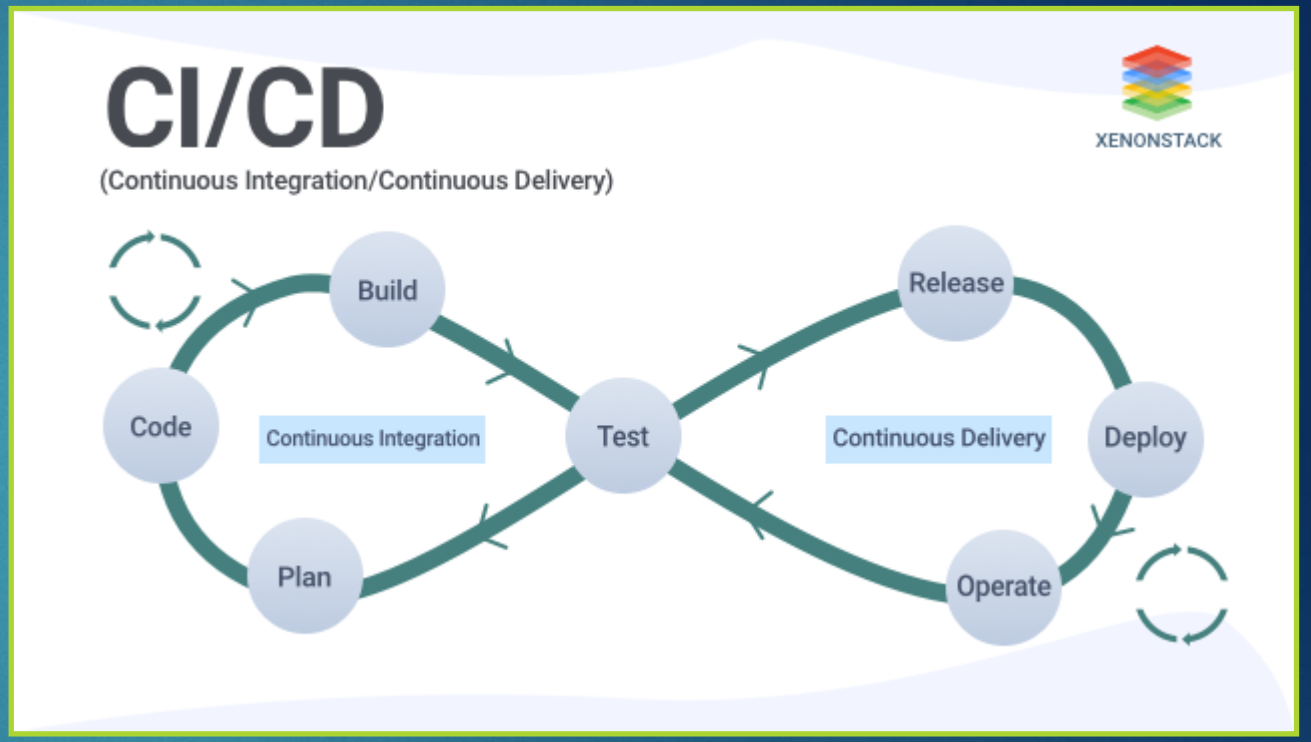
Benefits:

- Fewer outages, up-to-date code, better security, and lower time to market
- Feature deployment without disrupting critical services.
- Boost deployment frequency thus provides time to analyze more automation.



Before

After



Our transition will promote revenue growth, return on investment (ROI) along with customer experience.

Thank You!
